

Pulcap is a highly suppressive product, and it is probably the only one that has even achieved the total eradication of the red chicken mite from farms, which is usually possible with professional application in empty farm halls. In this way, you can ensure safe and continuous egg production for more than 8 months and up to a year and a half without using other products.

Application of Pulcap is also possible on inhabited farms which indicates that the product is absolutely safe and does not leave residues in eggs and meat. The safety of Pulcap is also reflected in the fact that it is the best solution for the red chicken mite in organic egg production.

Pulcap's effectiveness has been proven on many farms across numerous European countries: Italy, Poland, Slovenia, Hungary, Serbia, Romania, Bosnia and Herzegovina, Croatia, Montenegro, Bulgaria, Turkey...

Pulcap is a product for general use. It is used for protection and lubrication of cages in the poultry industry. The mechanical effect is that the greasy layer on the equipment eliminates mites and creates an unfavorable environment for the further development of the red poultry mite - *Dermanyssus gallinae*.

Pulcap application eliminates directly exposed mites and leaves a layer on the equipment for a long-term extended effect that also eliminates subsequently exposed mites. This prolonged effect is what differentiates this product from all competing products, because this layer is effective and deadly for several months.

APPLICATION PROCESS

- Primarily intended for use in empty cages, so that the effects last longer than 8 months i.e. 15 months.
- Can be used during the production period.

APPLICATION METHOD

- Shake the Pulcap pack well.
- Add the product to the water in a concentration of 10-15%.
- Mix intensively using a mixing device until a uniform emulsion is formed.
- Apply the emulsion within 20 minutes or mix again if continuous mixing is not possible.
- Spray on cages, equipment and surroundings.
- Use conical nozzles with higher flow (3-10 L/min).
- In order to achieve maximum effects, it is advised to wait at least 7 days after applying the product to empty cages before adding the young hens.

TIPS FOR MAXIMUM EFFICIENCY

- Application of 60-120L of emulsion per 1000 chickens.
- Raising the temperature to around 20°C in the hall after application until the young chicken enter (due to increased movement of mites)
- Adequate professional application or careful application to each part of the cage.

ABOUT PULCAP LIQUID

- Pulcap is a combination of inert oils.
- Toxicologically tested.
- It does not contain neurotoxins.

The red poultry mite cannot develop resistance to Pulcap, due to its purely mechanical effect.
